

10 | Linear Regression, Part 3

Ivan Corneillet

Data Scientist

Today, we will go deeper in a few linear regression topics, each with a different dataset:

- Model Fit and Customer Retention
- One-Hot Encoding for Categorical Variables and SF Housing
- Interaction Effects and Advertising
 - Hierarchy Principle

A black circle containing the white text 'DS'.

Linear Regression

One-Hot Encoding for Categorical Variables and SF Housing

Back to the SF housing dataset and the issue of beds and baths

- So far, we've considered *Beds* and *Baths* as ratio variables
 - Namely that the price premium between a property with 1 bathroom and another with 2 bathrooms was the same between a property with 3 bathrooms and another with 4 bathrooms
- Does this make sense?

| | | | |
|-------------------|---------------|---------------------|----------|
| Dep. Variable: | SalePrice | R-squared: | 0.137 |
| Model: | OLS | Adj. R-squared: | 0.136 |
| Method: | Least Squares | F-statistic: | 146.6 |
| Date: | | Prob (F-statistic): | 1.94e-31 |
| Time: | | Log-Likelihood: | -1690.7 |
| No. Observations: | 929 | AIC: | 3385. |
| Df Residuals: | 927 | BIC: | 3395. |
| Df Model: | 1 | | |
| Covariance Type: | nonrobust | | |

| | coef | std err | t | P> t | [95.0% Conf. Int.] |
|-----------|--------|---------|--------|-------|--------------------|
| Intercept | 0.3401 | 0.099 | 3.434 | 0.001 | 0.146 0.535 |
| Baths | 0.5242 | 0.043 | 12.109 | 0.000 | 0.439 0.609 |

| | | | |
|----------------|----------|-------------------|-------------|
| Omnibus: | 1692.623 | Durbin-Watson: | 1.582 |
| Prob(Omnibus): | 0.000 | Jarque-Bera (JB): | 2167434.305 |
| Skew: | 12.317 | Prob(JB): | 0.00 |
| Kurtosis: | 238.345 | Cond. No. | 5.32 |

Back to the SF housing dataset and the issue of bed and bath counts (cont.)

- Let's test this hypothesis and convert *Baths* to a nominal variable and then encode it into binary variables

| m (# bathrooms) | $Bath = \begin{pmatrix} Bath_1, \\ Bath_2, \\ Bath_3, \\ Bath_4 \end{pmatrix}$ (one-hot encoding) |
|-------------------|--|
| 1 | (1, 0, 0, 0) |
| 2 | (0, 1, 0, 0) |
| 3 | (0, 0, 1, 0) |
| 4 | (0, 0, 0, 1) |

One-hot encoding for categorical variables

- This terminology from digital circuits where *one-hot* refers to a group of bits (here, our binary features) among which the legal combinations of values are only those with a single high (1) bit and all the others low (0)
- (Binary variables are also called *dummy* variables)

DS

Linear Regression

Interaction Effects and Advertising

Is there a relationship between advertising budget and sales?

Sales ~ TV

Sales ~ Radio

Sales ~ Newspaper

Simple Linear Regressions on *TV*, *Radio*, and *Newspaper*

Sales ~ TV

| | | | |
|-------------------|---------------|---------------------|----------|
| Dep. Variable: | Sales | R-squared: | 0.607 |
| Model: | OLS | Adj. R-squared: | 0.605 |
| Method: | Least Squares | F-statistic: | 302.8 |
| Date: | | Prob (F-statistic): | 1.29e-41 |
| Time: | | Log-Likelihood: | -514.27 |
| No. Observations: | 198 | AIC: | 1033. |
| Df Residuals: | 196 | BIC: | 1039. |

$Sales \sim TV + Radio$. What do you observe? Are we done yet?

Residuals q-q plot

Residuals against TV

Residuals against $Radio$

$Sales \sim TV + Radio$

$$\triangleright Sales = \underbrace{2.93}_{\hat{\beta}_0} + \underbrace{.0457}_{\hat{\beta}_1} \times TV + \underbrace{.188}_{\hat{\beta}_2} \times Radio$$

- This model assumes that the effect on sales of increasing one media (e.g., *TV*) is independent of the amount spent on the other media (e.g., *Radio*)
- More specifically, the model states that the average effect on sales of a one-unit increase (\$1k) in *TV* is always ($\underbrace{.0457}_{\hat{\beta}_1} [1k \text{ units}] = 46 \text{ units}$), regardless of the amount spend on *Radio*

Interaction Effects

- But suppose that spending money on radio advertising actually increases the effectiveness of *TV* advertising
 - the slope term for *TV* should increase as *Radio* increases
- E.g., given a fixed budget of \$100k, spending half on TV and half on radio may increase sales more than allocating the entire amount to either TV or radio
- This is known as a synergy effect in marketing; in statistics it is referred to as an interaction effect

$$\text{Sales} \sim \text{TV} + \text{Radio} + \text{TV} * \text{Radio}$$

| | | | |
|-------------------|---------------|---------------------|-----------|
| Dep. Variable: | Sales | R-squared: | 0.968 |
| Model: | OLS | Adj. R-squared: | 0.967 |
| Method: | Least Squares | F-statistic: | 1934. |
| Date: | | Prob (F-statistic): | 3.19e-144 |
| Time: | | Log-Likelihood: | -267.07 |
| No. Observations: | 198 | AIC: | 542.1 |
| Df Residuals: | 194 | BIC: | 555.3 |
| Df Model: | 3 | | |
| Covariance Type: | nonrobust | | |

| | coef | std err | t | P> t | [95.0% Conf. Int.] |
|-----------|--------|----------|--------|-------|--------------------|
| Intercept | 6.7577 | 0.247 | 27.304 | 0.000 | 6.270 7.246 |
| TV | 0.0190 | 0.002 | 12.682 | 0.000 | 0.016 0.022 |
| Radio | 0.0276 | 0.009 | 3.089 | 0.002 | 0.010 0.045 |
| TV:Radio | 0.0011 | 5.27e-05 | 20.817 | 0.000 | 0.001 0.001 |

| | | | |
|----------------|---------|-------------------|-----------|
| Omnibus: | 126.182 | Durbin-Watson: | 2.241 |
| Prob(Omnibus): | 0.000 | Jarque-Bera (JB): | 1151.060 |
| Skew: | -2.306 | Prob(JB): | 1.12e-250 |
| Kurtosis: | 13.875 | Cond. No. | 1.78e+04 |

Interaction Effects (cont.)

- $Sales = \underbrace{6.76}_{\hat{\beta}'_0} + \underbrace{.0190}_{\hat{\beta}'_1} \times TV + \underbrace{.0276}_{\hat{\beta}'_2} \times Radio + \underbrace{.0011}_{\hat{\beta}'_3} \times TV \times Radio$
- The interaction is important
 - β'_3 is statistically significant
 - R^2 with this model went up to 96.8% up from 89.5% for the model without interaction. This that $1 - \frac{1-.968}{1-.895} = .70 = 70\%$ of the unexplained variability in the previous model has been explained by the interaction term

Hierarchy Principle

- Sometimes an interaction term $x_i \cdot x_j$ is significant, but one or both of its main effects (in this case x_i and/or x_j) are not

- The hierarchy principle
 - If we include an interaction in a model, we should also include the main effects, even if they aren't significant
